ABNORMALITIES OF THE NOSE

Although many skin diseases can affect the nose in general, there are only a few especially affecting the nasal planum. Some of them are only benign cosmetic conditions, while others can be severe or even life threatening. The lecture will provide details on how to work up dermatologic conditions affecting primarily the nasal planum in general practice, so one can formulate a differential list and create a diagnostic plan. More background information will be given for the most relevant diseases.
